

MAGNETOHYDRODYNAMICS of Laboratory and Astrophysical Plasmas

With 90% of visible matter in the Universe existing in the plasma state, an understanding of magnetohydrodynamics is essential for anyone looking to understand solar and astrophysical processes, from stars to accretion discs and galaxies; as well as laboratory applications focused on harnessing controlled fusion energy.

This introduction to magnetohydrodynamics brings together the theory of plasma behavior with advanced topics including the applications of plasma physics to thermonuclear fusion and plasma-astrophysics. Topics covered include streaming and toroidal plasmas, nonlinear dynamics, modern computational techniques, incompressible plasma turbulence and extreme transonic and relativistic plasma flows. The numerical techniques needed to apply magnetohydrodynamics are explained, allowing the reader to move from theory to application and exploit the latest algorithmic advances. Bringing together two previous volumes: *Principles of Magnetohydrodynamics* and *Advanced Magnetohydrodynamics*, and completely updated with new examples, insights and applications, this volume constitutes a comprehensive reference for students and researchers interested in plasma physics, astrophysics and thermonuclear fusion.

HANS GOEDBLOED is Advisor of the Dutch Institute for Fundamental Energy Research (DIFFER), and Professor Emeritus of Theoretical Plasma Physics at Utrecht University. He has been a visiting scientist at laboratories in the Soviet Union, the United States, Brazil and Europe. He has taught at Campinas, Rio de Janeiro, São Paulo, Massachusetts Institute of Technology, Katholieke Universiteit Leuven, Amsterdam Free University and Utrecht University. For many years he coordinated an interdisciplinary and large-scale computational effort with the Dutch Science Organisation on ‘Fast Changes in Complex Flows.’

RONY KEPPENS is Professor and Division Chair at the Centre for mathematical Plasma-Astrophysics, Katholieke Universiteit Leuven. He headed numerical plasma dynamics teams at FOM-Institute for Plasma Physics ‘Rijnhuizen’ (now DIFFER) and Leuven and frequently lectures on computational methods in astrophysics. His career started at the National Center for Atmospheric Research, Boulder, and the Kiepenheuer Institute for Solar Physics, Freiburg. He held a professorship at Utrecht University and a concurrent professorship at Nanjing University. His expertise ranges from solar to high-energy astrophysics and includes parallel computing and grid-adaptivity.

STEFAN POEDTS is Professor and Chair of the Department of Mathematics at Katholieke Universiteit Leuven. He was a post-doctoral researcher at the Max Planck Institute for Plasma Physics, Garching, a senior researcher at the FOM-Institute for plasma physics ‘Rijnhuizen’, and research associate at the Centre for mathematical Plasma-Astrophysics, Katholieke Universiteit Leuven. His research interests include solar physics, space weather, thermonuclear fusion, MHD (in)stability, and multi-fluid modelling. He teaches basic math courses, and advanced courses on plasma physics of the Sun and numerical simulation.

<i>Preface</i>	<i>page xvii</i>
Part I Plasma Physics Preliminaries	1
1 Introduction	3
1.1 Motivation	3
1.2 Thermonuclear fusion and plasma confinement	4
1.2.1 Fusion reactions	4
1.2.2 Conditions for fusion	6
1.2.3 Magnetic confinement and tokamaks	9
1.3 Astrophysical plasmas	11
1.3.1 Celestial mechanics	11
1.3.2 Astrophysics	13
1.3.3 Plasmas enter the stage	15
1.3.4 The standard view of nature	17
1.4 Definitions of the plasma state	19
1.4.1 Microscopic definition of plasma	19
1.4.2 Macroscopic approach to plasma	23
1.5 Literature and exercises	24
2 Elements of plasma physics	27
2.1 Theoretical models	27
2.2 Single particle motion	27
2.2.1 Cyclotron motion	27
2.2.2 Excursion: Basic equations of electrodynamics and mechanics	30
2.2.3 Drifts, adiabatic invariants	33
2.3 Kinetic plasma theory	38
2.3.1 Boltzmann equation and moment reduction	38
2.3.2 Collective phenomena: plasma oscillations	43
2.3.3 Landau damping	46
2.4 Fluid description	52
2.4.1 From the two-fluid to the MHD description of plasmas	53
2.4.2 Alfvén waves	57
2.4.3 Equilibrium and stability	59

2.5	In conclusion	63
2.6	Literature and exercises	64
3	‘Derivation’ of the macroscopic equations*	66
3.1	Two approaches*	66
3.2	Kinetic equations*	67
3.2.1	Boltzmann equation*	67
3.2.2	Moments of the Boltzmann equation*	70
3.2.3	Thermal fluctuations and transport*	72
3.2.4	Collisions and closure*	75
3.3	Two-fluid equations*	78
3.3.1	Electron–ion plasma*	78
3.3.2	The classical transport coefficients*	79
3.3.3	Dissipative versus ideal fluids*	83
3.3.4	Excursion: waves in two-fluid plasmas*	86
3.4	One-fluid equations*	95
3.4.1	Maximal ordering for MHD*	95
3.4.2	Resistive and ideal MHD equations*	99
3.5	Literature and exercises*	101
	Part II Basic Magnetohydrodynamics	103
4	The MHD model	105
4.1	The ideal MHD equations	105
4.1.1	Postulating the basic equations	105
4.1.2	Scale independence	110
4.1.3	A crucial question	112
4.2	Magnetic flux	113
4.2.1	Flux tubes	113
4.2.2	Global magnetic flux conservation	114
4.3	Conservation laws	116
4.3.1	Conservation form of the MHD equations	116
4.3.2	Global conservation laws	118
4.3.3	Local conservation of magnetic flux	121
4.3.4	Magnetic helicity	124
4.4	Dissipative magnetohydrodynamics	128
4.4.1	Resistive MHD	128
4.4.2	(Non-)conservation form of the dissipative equations*	131
4.5	Discontinuities	133
4.5.1	Shocks and jump conditions	133
4.5.2	Boundary conditions for plasmas with an interface	136
4.6	Model problems	138
4.6.1	Laboratory plasmas (models I–III)	138
4.6.2	Energy conservation for interface plasmas	141
4.6.3	Astrophysical plasmas (models IV–VI)	143

4.7	Literature and exercises	144
5	Waves and characteristics	147
5.1	Physics and accounting	147
5.1.1	Introduction	147
5.1.2	Sound waves	147
5.2	MHD waves	150
5.2.1	Symmetric representation in primitive variables	150
5.2.2	Entropy wave and magnetic field constraint	152
5.2.3	Reduction to velocity representation: three waves	155
5.2.4	Dispersion diagrams	157
5.3	Phase and group diagrams	159
5.3.1	Basic concepts	159
5.3.2	Application to the MHD waves	161
5.3.3	Asymptotic properties	165
5.3.4	Self-gravity and contraction in homogeneous media*	166
5.4	Characteristics*	169
5.4.1	The method of characteristics*	169
5.4.2	Classification of partial differential equations*	171
5.4.3	Characteristics in ideal MHD*	173
5.5	Literature and exercises	179
6	Spectral theory	181
6.1	Stability: intuitive approach	181
6.1.1	Two viewpoints	181
6.1.2	Linearization and Lagrangian reduction	183
6.2	Force operator formalism	186
6.2.1	Equation of motion	186
6.2.2	Hilbert space	190
6.2.3	Proof of self-adjointness of the force operator	191
6.3	Spectral alternatives*	196
6.3.1	Mathematical intermezzo*	196
6.3.2	Initial value problem in MHD*	198
6.4	Quadratic forms and variational principles	200
6.4.1	Expressions for the potential energy	200
6.4.2	Hamilton's principle	202
6.4.3	Rayleigh–Ritz spectral variational principle	203
6.4.4	Energy principle	204
6.5	Further spectral issues	206
6.5.1	Normal modes and the energy principle*	206
6.5.2	Proof of the energy principle*	207
6.5.3	σ -stability	209
6.5.4	Returning to the two viewpoints	210
6.6	Extension to interface plasmas	213
6.6.1	Boundary conditions at the interface	215

6.6.2	Self-adjointness for interface plasmas	218
6.6.3	Extended variational principles	219
6.6.4	Application to the Rayleigh–Taylor instability	221
6.7	Literature and exercises	229
	Part III Standard Model Applications	231
7	Waves and instabilities of inhomogeneous plasmas	233
7.1	Hydrodynamics of the solar interior	233
7.1.1	Radiative equilibrium model	234
7.1.2	Convection zone	237
7.2	Hydrodynamic waves and instabilities of a gravitating slab	239
7.2.1	Hydrodynamic wave equation	239
7.2.2	Convective instabilities	241
7.2.3	Gravito-acoustic waves	242
7.2.4	Helioseismology and MHD spectroscopy	245
7.3	MHD wave equation for a gravitating magnetized plasma slab	248
7.3.1	Preliminaries	248
7.3.2	MHD wave equation for a gravitating slab	252
7.3.3	Gravito-MHD waves	258
7.4	Continuous spectrum and spectral structure	265
7.4.1	Singular differential equations	265
7.4.2	Alfvén and slow continua	269
7.4.3	Oscillation theorems	273
7.4.4	Cluster spectra*	278
7.5	Gravitational instabilities of a magnetized plasma slab	279
7.5.1	Energy principle for a gravitating plasma slab	280
7.5.2	Interchanges in shearless magnetic fields	283
7.5.3	Interchange instabilities in sheared magnetic fields	285
7.6	Literature and exercises	289
8	Magnetic structures and dynamics of the solar system	292
8.1	Plasma dynamics in laboratory and nature	292
8.2	Solar magnetism	293
8.2.1	The solar cycle	294
8.2.2	Magnetic structures in the solar atmosphere	300
8.2.3	Inspiration from solar magnetism	309
8.2.4	Solar wind and heliosphere	309
8.3	Space weather	313
8.3.1	Technological and economic implications	313
8.3.2	Coronal mass ejections	314
8.3.3	Numerical modelling of space weather	317
8.3.4	Solar wind and planetary magnetospheres	320
8.4	Perspective	321
8.5	Literature and exercises	322

9	Cylindrical plasmas	325
9.1	Equilibrium of cylindrical plasmas	325
9.1.1	Diffuse plasmas	325
9.1.2	Interface plasmas	329
9.2	MHD wave equation for cylindrical plasmas	330
9.2.1	Derivation of the MHD wave equation for a cylinder	330
9.2.2	Boundary conditions for cylindrical interfaces	336
9.3	Spectral structure	339
9.3.1	One-dimensional inhomogeneity	339
9.3.2	Cylindrical model problems	341
9.3.3	Cluster spectra*	347
9.4	Stability of cylindrical plasmas	348
9.4.1	Oscillation theorems for stability	348
9.4.2	Stability of plasmas with shearless magnetic fields	353
9.4.3	Stability of force-free magnetic fields*	357
9.4.4	Stability of the ‘straight tokamak’	361
9.5	Literature and exercises	369
10	Initial value problem and wave damping*	372
10.1	Implications of the continuous spectrum*	372
10.2	Initial value problem*	373
10.2.1	Reduction to a one-dimensional representation*	373
10.2.2	Restoring the three-dimensional picture*	376
10.3	Damping of Alfvén waves*	380
10.3.1	Green’s function*	381
10.3.2	Spectral cuts*	384
10.4	Quasi-modes*	386
10.5	Leaky modes*	392
10.6	Literature and exercises*	397
11	Resonant absorption and wave heating	399
11.1	Ideal MHD theory of resonant absorption	399
11.1.1	Analytical solution of a simple model problem	399
11.1.2	Role of the singularity	405
11.1.3	Resonant ‘absorption’ versus resonant ‘dissipation’	414
11.2	Heating and wave damping in tokamaks and coronal loops	417
11.2.1	Tokamaks	417
11.2.2	Coronal loops and arcades	418
11.2.3	Numerical analysis of resonant absorption	419
11.3	Alternative excitation mechanisms	423
11.3.1	Foot point driving	424
11.3.2	Phase mixing	427
11.3.3	Applications to solar and magnetospheric plasmas	428
11.4	Literature and exercises	432

Part IV Flow and Dissipation	435
12 Waves and instabilities of stationary plasmas	437
12.1 Laboratory and astrophysical plasmas	437
12.1.1 Grand vision: magnetized plasma on all scales!	437
12.1.2 Laboratory and astrophysical plasmas	440
12.1.3 Interchanges and the Parker instability	441
12.2 Spectral theory of stationary plasmas	445
12.2.1 Plasmas with background flow	445
12.2.2 Frieman–Rotenberg formulation	448
12.2.3 Self-adjointness of the generalized force operator*	453
12.2.4 Energy conservation and stability	456
12.3 The Spectral Web	462
12.3.1 Opening up the boundaries	462
12.3.2 Oscillation theorems in the complex plane	466
12.4 Literature and exercises	471
13 Shear flow and rotation	473
13.1 Spectral theory of plane plasmas with shear flow	473
13.1.1 Gravito-MHD wave equation for plane plasma flow	473
13.1.2 Kelvin–Helmholtz instabilities in interface plasmas	478
13.1.3 Continua and the real oscillation theorem	480
13.1.4 Spectral Web and the complex oscillation theorem	484
13.2 Analysis of flow-driven instabilities in plane plasmas	486
13.2.1 Rayleigh–Taylor instabilities of magnetized plasmas	488
13.2.2 Kelvin–Helmholtz instabilities of ordinary fluids	489
13.2.3 Combined instabilities of magnetized plasmas	494
13.3 Spectral theory of rotating plasmas	498
13.3.1 MHD wave equation for cylindrical flow in 3D	498
13.3.2 Reduction to a second order differential equation	500
13.3.3 Singular expansions*	502
13.3.4 Doppler–Coriolis shift and solution path	505
13.4 Rayleigh–Taylor instabilities in rotating theta-pinches	506
13.4.1 Hydrodynamic modes ($k = 0$)	507
13.4.2 Magnetohydrodynamic modifications ($k \neq 0$)	511
13.5 Magneto-rotational instability in accretion discs	513
13.5.1 Analytical preliminaries	514
13.5.2 Numerical Spectral Web solutions	518
13.6 Literature and exercises	523
14 Resistive plasma dynamics	525
14.1 Plasmas with dissipation	525
14.1.1 Conservative versus dissipative dynamical systems	525
14.1.2 Stability of force-free magnetic fields: a trap	525
14.2 Resistive instabilities	532
14.2.1 Basic equations	532

	<i>Contents</i>	xiii
14.2.2	Tearing modes	534
14.2.3	Resistive interchange modes	543
14.3	Resistive spectrum	544
14.3.1	Resistive wall mode	544
14.3.2	Spectrum of homogeneous plasma	548
14.3.3	Spectrum of inhomogeneous plasma	551
14.4	Reconnection	554
14.4.1	Reconnection in a 2D Harris sheet	554
14.4.2	Petschek reconnection	558
14.4.3	Kelvin–Helmholtz induced tearing instabilities	559
14.4.4	Extended MHD and reconnection	560
14.5	Excursion: Hall-MHD wave diagrams	563
14.6	Literature and exercises	566

16.3.1	Poloidal flux scaling	647
16.3.2	Soloviev equilibrium	652
16.3.3	Numerical equilibria*	655
16.4	Extensions	660
16.4.1	Toroidal rotation	660
16.4.2	Gravitating plasma equilibria*	662
16.4.3	Challenges	663
16.5	Literature and exercises	664
17	Linear dynamics of static toroidal plasmas	667
17.1	“Ad more geometrico”	667
17.1.1	Alfvén wave dynamics in toroidal geometry	667
17.1.2	Coordinates and mapping	667
17.1.3	Geometrical–physical characteristics	668
17.2	Analysis of waves and instabilities in toroidal geometry	674
17.2.1	Spectral wave equation	674
17.2.2	Spectral variational principle	676
17.2.3	Alfvén and slow continuum modes	677
17.2.4	Poloidal mode coupling	680
17.2.5	Alfvén and slow ballooning modes	683
17.3	Computation of waves and instabilities in tokamaks	690
17.3.1	Ideal MHD versus resistive MHD in computations	690
17.3.2	Internal modes	695
17.3.3	Edge localized modes	697
17.3.4	Toroidal Alfvén eigenmodes and MHD spectroscopy	701
17.4	Literature and exercises	704
18	Linear dynamics of toroidal plasmas with flow*	707
18.1	Transonic toroidal plasmas	707
18.2	Axi-symmetric equilibrium of transonic stationary states*	709
18.2.1	Equilibrium flux functions*	709
18.2.2	Equilibrium variational principle and rescaling*	712
18.2.3	Elliptic and hyperbolic flow regimes*	715
18.2.4	Expansion of the equilibrium in small toroidicity*	716
18.3	Equations for the continuous spectrum*	722
18.3.1	Reduction for straight-field-line coordinates*	722
18.3.2	Continua of poloidally and toroidally rotating plasmas*	725
18.3.3	Analysis of trans-slow continua for small toroidicity*	731
18.4	Trans-slow continua in tokamaks and accretion discs*	737
18.4.1	Tokamaks and magnetically dominated accretion discs*	738
18.4.2	Gravity dominated accretion discs*	740
18.4.3	Trans-slow Alfvén continuum instabilities	742
18.5	Literature and exercises*	744

Part VI Nonlinear Dynamics	747
19 Turbulence in incompressible magneto-fluids	749
19.1 Incompressible hydrodynamics preliminaries	749
19.1.1 The incompressible hydro model	749
19.1.2 Two-dimensional formulations	751
19.1.3 ‘Wave’ analysis for incompressible Euler	751
19.1.4 Energy equation and Kolmogorov scaling	753
19.1.5 Selected numerical examples	756
19.2 Incompressible magnetohydrodynamics	758
19.2.1 Governing equations	758
19.2.2 Elsässer formulation	759
19.2.3 Kinematic MHD modelling	760
19.2.4 Dynamo aspects	761
19.3 Waves in incompressible MHD	764
19.3.1 Linear wave analysis	765
19.3.2 Nonlinear wave solutions and conservation laws	766
19.3.3 MHD turbulence scaling laws	768
19.4 Incompressible MHD simulations	771
19.4.1 Structure formation in incompressible MHD studies	772
19.4.2 Dynamo aspects continued	774
19.5 Extension to compressible MHD and concluding remarks	776
19.6 Literature and exercises	778
20 Computational nonlinear MHD	780
20.1 General considerations for nonlinear conservation laws	780
20.1.1 Conservative versus primitive variable formulations	780
20.1.2 Scalar conservation law and the Riemann problem	786
20.1.3 Numerical discretizations for scalar conservation	790
20.1.4 Finite volume treatments	796
20.2 Upwind-like finite volume treatments for one-dimensional MHD	797
20.2.1 The Godunov method	798
20.2.2 A robust shock-capturing method: TVDLF	802
20.2.3 Approximate Riemann solver schemes	807
20.2.4 Simulating 1D MHD Riemann problems	811
20.3 Multi-dimensional MHD computations	813
20.3.1 $\nabla \cdot \mathbf{B} = 0$ condition for shock-capturing schemes	814
20.3.2 Example nonlinear MHD scenarios	819
20.3.3 Alternative numerical methods	822
20.4 Implicit approaches for extended MHD simulations	827
20.4.1 Semi-implicit methods	828
20.4.2 Simulating ideal and resistive instabilities	832
20.4.3 Global simulations for tokamak plasmas	833
20.5 Literature and exercises	834

21	Transonic MHD flows and shocks	837
21.1	Transonic flows	837

Preface

This book describes the two main applications of plasma physics, laboratory research on thermonuclear fusion energy and plasma-astrophysics of astronomical systems, from the single viewpoint of magnetohydrodynamics (MHD). This provides effective methods and insights for the interpretation of plasma phenomena on virtually all scales, ranging from the laboratory to the Universe. The key issue is understanding the complexities of plasma dynamics in extended magnetic structures. In the first half of the book, based on a revision of the previous volume *Principles of Magnetohydrodynamics* [1], the classical MHD model is developed in great detail without omitting steps in the derivations. This necessitated restriction to ideal dissipationless plasmas, in static equilibrium and inhomogeneous in one direction. In the second half of the book, based on a revision of the previous *Advanced Magnetohydrodynamics* [2], these restrictions are relaxed one by one: introducing stationary background flows, dissipation, two-dimensional toroidal geometry, linear and nonlinear computational techniques, turbulence, transonic flows and relativity. These topics transform the subject into a vital new area with numerous applications in laboratory, space and astrophysical plasmas. It is impossible to treat all topics that actually belong to the field of advanced MHD. Fortunately, books or chapters of books exist on some of those topics, like *dynamos* [444, 475, 174, 533], *solar magnetohydrodynamics* [510], *chaos* [649], *stellarators* [185], *spheromaks* [48] and *anomalous transport* [33, 662].

Inevitably, with the distinction between topics for Chapters 1–11 (mostly ideal linear phenomena described by self-adjoint linear operators) and Chapters 12–22 (mostly non-ideal and nonlinear phenomena), the difference between ‘basic’ and ‘advanced’ levels of magnetohydrodynamics could not strictly be maintained. The logical order required a quite advanced derivation of the MHD equations from kinetic theory (Chapter 3) at an early stage, different sections on advanced topics interspersed throughout the book, and rather complicated analyses of the initial value problem (Chapter 10) and flow in toroidal systems (Chapter 18). These parts are marked by a star (★) and can be skipped on a first study of the book. The same applies to text put in small print, in between triangles (▷ ⋯ ◁), usually containing tedious derivations or advanced material. The serious student is advised though not to skip the Exercises, which are also put in small print for typographical reasons. Frequent use of the vector expressions and tables of the Appendices is encouraged. Magnetohydrodynamics can only be mastered through intense practice.

An overview of the subject matter of the different parts and chapters of this book may help the reader to find his way.

Part I (Plasma physics preliminaries)

- Chapter 1 gives an introduction to laboratory fusion and astrophysical plasmas, and formulates provisional microscopic and macroscopic definitions of the plasma state.
- Chapter 2 discusses the three complementary points of view of single particle motion, kinetic theory and fluid description. The corresponding theoretical models provide the opportunity to introduce some of the basic concepts of plasma physics.
- Chapter 3 gives the ‘derivation’ of the macroscopic equations from the kinetic equations. Quotation marks because a fully satisfactory derivation can not be given at present in view of the largely unknown contribution of turbulent transport processes. The presentation provides some impression of the limitations of the macroscopic model.

Part II (Basic magnetohydrodynamics)

- Chapter 4 defines the MHD model and introduces the concept of scale independence. The central importance of the conservation laws is discussed at length. Based on this, the similarities and differences of laboratory and astrophysical plasmas are articulated in terms of a set of generic boundary value problems.
- Chapter 5 derives the basic MHD waves and describes their properties, with an eye on their role in spectral analysis and computational MHD. The theory of characteristics is introduced as a way to describe the propagation of nonlinear disturbances.
- Chapter 6 treats the subject of waves and instabilities from the unifying point of view of spectral theory. The force operator formulation and the energy principle are extensively discussed. The analogy with quantum mechanics is pointed out and exploited.

Part III (Standard model applications)

- Chapter 7 applies the spectral analysis of Chapter 6 to inhomogeneous plasmas in a plane slab. The wave equation for gravito-MHD waves is derived and solved in various limits. Here, all the intricacies of the subject enter: continuous spectra, damping of Alfvén waves, local instabilities, etc. The topic of MHD spectroscopy is shown to hold great promise for the diagnostics of plasma dynamics.
- Chapter 8 introduces the enormous variety of magnetic phenomena in astrophysics, in particular for the solar system (dynamo, solar wind, space weather, etc.), and provides basic examples of plasma dynamics worked out in later chapters.
- Chapter 9 is the cylindrical counterpart of Chapter 7, with a wave equation describing the various waves and instabilities. It presents the stability analysis of diffuse cylindrical plasmas (classical pinches and present tokamaks) from the spectral perspective.
- Chapter 10 solves the initial value problem for one-dimensional inhomogeneous MHD and the associated damping due to the continuous spectrum.
- Chapter 11 discusses resonant absorption and phase mixing in the context of heating mechanisms of laboratory plasmas, and solar or stellar coronae. Sunspot seismology is introduced as another example of MHD spectroscopy.

Part IV (Flow and dissipation)

- Chapter 12 initiates the most urgent extension of the theory of Chapters 1–10, viz. waves and instabilities in plasmas with stationary background flows, a theme of great interest for laboratory fusion and astrophysical plasma research. The old problem of how to find the complex eigenvalues of stationary plasmas is solved by means of the new method of constructing the Spectral Web in the complex plane.
- Chapter 13 applies the new theory of the Spectral Web to the two classical topics of shear flow in plane plasma slabs, including the Kelvin–Helmholtz instability, and rotation in cylindrical plasmas, including the magneto-rotational instability.
- Chapter 14 treats the considerable modification of plasma dynamics when resistivity is introduced in the MHD description, both in the linear domain of spectral theory and in the nonlinear domain of reconnection.
- Chapter 15 introduces the basic techniques of computational MHD, the discretization techniques, the methods of time stepping, etc. It thus provides the modern techniques needed to solve for the dynamics of plasmas in complicated magnetic geometries.

Part V (Toroidal geometry)

- Chapter 16 presents the classical theory of static equilibrium of toroidal plasmas, a topic of central interest in fusion research of tokamaks.
- Chapter 17 concerns the spectral theory of waves and instabilities in toroidal equilibria, again a central topic in tokamak research. Because of this important application, this part of MHD spectral theory is the most developed one, also with respect to comparison with experimental data. This activity is called MHD spectroscopy.
- Chapter 18 introduces the theory of transonic equilibria and spectral theory of toroidal equilibria rotating in both directions, a subject of great interest but still in its infancy.

Part VI (Nonlinear dynamics)

- Chapter 19 introduces the topic of 2D turbulence in magneto-fluids by deriving the scaling laws for MHD turbulence and presenting the high performance computing efforts needed to resolve the structures that occur.
- Chapter 20 presents the counterpart of Chapter 15 by introducing the numerical methods for nonlinear MHD, in particular for plasmas with large background flows, applied in the last two chapters of this book.
- Chapter 21 discusses the MHD shock conditions from a new perspective, scale independence leading to time reversal duality, and it introduces some of the important areas of application of nonlinear MHD, viz. astrophysical winds and transonic flows.
- Chapter 22 introduces special relativistic MHD, in particular the linear waves and nonlinear shocks that occur at relativistic speeds. The book ends with applications to astrophysical phenomena, like relativistic jets, and thus completes the panorama of the tremendously exciting field of magnetohydrodynamics dominated by flows.

The Appendices provide the essentials of the two indispensable tools for MHD calculations, vector relations and orders of magnitude of the plasma parameters.

We wish to acknowledge Guido Huysmans, Jelle Kaastra, Giovanni Lapenta, Sasha Lifschitz, Zakaria Meliani, Gábor Tóth, Ronald Van der Linden, Oliver Porth, Rob Rutten, Henk van der Vorst and Chun Xia for constructive comments on different chapters, Victor Land and Jan Willem Blokland for their contributions to the exercises, Paul Cally, Antoine Cerfon, Bassem Girgis, Pieter Groen, Ian Hutchinson, Ralph Kube and Ryan White for helpful criticism on the previous volumes, and Bram Achterberg, Hubert Baty, Sander Beliën, Nicolas Bessolaz, Tom Bogdan, Fabien Casse, Antoine Cerfon, Paul Charbonneau, Arpád Csík, Herman Deconinck, Peter Delmont, Hans De Sterck, Dan D’Ippolito, Jeff Freidberg, Ricardo Galvão, Marcel Goossens, Giel Halberstadt, Tony Hearn, Bart van der Holst, Hanno Holties, Alan Hood, Wolfgang Kerner, Rob Kleiberger, Max Kuperus, Boon Chye Low, Keith MacGregor, Daniel Mueller, Valery Nakariakov, Ronald Nijboer, Eric Priest, Jan Rem, Bernard Roberts, Andro Rogava, Ilia Roussev, Paulo Sakanaka, Brigitte Schmieder, Karel Schrijver and Lydia Van Driel-Gesztelyi for fruitful collaborations and discussions.

The first author is indebted to Jeff Freidberg for scientific stimulation and friendship for many years. He is also thankful to past and present management of DIFFER (formerly FOM-Institute for Plasma Physics ‘Rijnhuizen’), Marnix van der Wiel, Aart Kleyn, Niek Lopes Cardozo, Noud Oomens, Jan Kranenburg, Richard van de Sanden, Tony Donné and Marco de Baar, for having provided optimum conditions to work on these books. We wish to thank Simon Capelin of Cambridge University Press for his support and patience over all the years of preparation of this book and the previous volumes. We are indebted to the content manager Roisin Munnely for helpful assistance and to the copy editor Jon Billam for very careful editing of this book.
